

Thermal switch range

Dear Customers,

Thermal switches for the temperature range up to 200°C from EAW contain bronze contact elements as standard.

To optimize the price, contact elements made of brass could previously also be configured with slightly higher self-heating.

The contact systems made of both materials have been tried and tested for decades and are certified by both VDE and UL.

Procurement irregularities in recent years, particularly around the metal alloys used by EAW, forced EAW to optimize procurement processes. As a result of our work, we are pleased to be able to inform our customers of the following:

The combination of the required quantities of the bronze and brass alloys used for the two contact systems, the associated increase in the purchase quantities and the simplification of the administrative processes give us the opportunity in future to equip all thermal switches with the higher-quality bronze contact elements without any material-related surcharge.

Against this background, we have decided to upgrade the thermal switch types that are already equipped with brass contact systems with bronze contact systems without any material-related surcharge.
